

To Whom it May Concern,

I am writing to express my concerns for **HB 3063**. While I am not opposed to vaccinating, I also feel it is extremely important to afford people a choice when it comes to their children's wellbeing. If vaccines were 100% safe and effective, then the choice to vaccinate would be a no-brainer for many of us. Unfortunately, there is actual cause for concern when it comes to the possibility of an adverse reaction from a vaccine, and sometimes those reactions can be life altering or life threatening. I am not talking about the MMR vaccine causing autism- we all know that myth has been debunked. However, there is enough research and cautionary statements from both vaccine manufacturers and the VAERS reporting system (regulated by the CDC and the FDA) that demonstrate the fact that vaccines carry their own inherent risks.

Part of this risk is due to some of the additive ingredients in vaccines. The most alarming to me are Aluminum, Polysorbate 80, FORMALDEHYDE, ABORTED FETAL TISSUE AND ANIMAL DNA. Aluminum mixed with Polysorbate 80 crosses the blood brain barrier. The amount of aluminum far exceeds the safe recommended dose in just one vaccine. There has not been adequate research or safety tests on the effects of aluminum and the amounts that are given in these vaccines.

I am also concerned about the fact that **pharmaceutical companies that make these vaccines are 100% exempt from liability**. This is a 60 billion dollar industry that has LEGAL IMMUNITY from lawsuits if my child were to be injured by their vaccine. What accountability do these companies have to make a safe product when they are exempt from liability, and their purpose is to profit as opposed to altruistically keeping the population healthy? I question the integrity of a system that allows vaccine makers to "donate" millions of dollars every year to the people who help determine the suggested vaccine schedule (American Academy of Pediatrics), and allows vaccine makers to conduct their own safety studies on their own product.

Recently, **Robert F. Kennedy sued the government, and won, because there have been no independent studies on how these vaccines are affecting our children for the last 30 years**. As a part of the Vaccine Act of 1986, when pharmaceutical companies became exempt from liability, the HHS Secretary was responsible for reporting their findings each year to Congress including safety and efficacy research, manufacturing and licensing research and adverse reaction reporting. However, HHS filed no reports on vaccine safety for 30 years. Please click article below to read in more detail.

HB 3063 would require all vaccines to be completed on a particular vaccination schedule in order for a child to attend school. This would be requiring parents to put their children at risk for adverse reactions that have not been adequately tested, or reported, and subject their children to a system that lacks integrity and accountability. I feel this level of government intervention in our medical and personal choices is unwarranted, and frankly unsafe. In conclusion, there needs to be more research, accountability, and integrity in the system before requiring mandatory vaccines for all children. Thank you for your time and consideration in this matter, and I hope you will choose to **oppose HB 3063 and allow your constituents to retain their medical freedom**.
