

Towards a clear future of best scientific practice I request HB 3063 not be supported in our legislature. Vaccines have created a great world in which we do not fear some diseases but our world has changed and the best science research is when we have the will to continue to question what is the best way forward for all. I believe we need better vaccines, always assessing data to make sure there are not cases where children could be put in danger who suffer from auto immune or other health struggles. One could argue that unvaccinated children could put other children at risk but we digress if we argue one child's life against another. For the highest level of safety we need to put scrutiny on vaccines and hold drug companies to this high level.

When I was told that my daughter's extreme reaction to her MMR vaccine was not extreme enough to note I knew they were wrong or minimizing. I believe in protecting all children in the way each child deserves not asking the child to fit in a box. We chose an alternate vaccine schedule that now states my daughter is unvaccinated, which is not true. When we stop looking at the scientific results of a persons health the guidance of health care must be called into question, held to higher standards and better health assessments for best vaccine schedules should be addressed with a doctor who knows a child's health. No law should pretend to know this, it simply does not bear fruit or sustain best health care practice.

Thank you,
Jess Beebe
